

Resistance to Heat Test Fixture

BQ Technologies' resistance to heat test fixture allows testing of three cards at one time. A card's ability to resist heat is determined by exposing the cards to certain climatic conditions over time, then measuring the mechanical deformation caused by the influence of gravity.

BQ Technologies' resistance to heat fixture features splayed feet and aggressive no-slip rubber pads for optimum stability. It is manufactured of aerospace-grade aluminum alloy with a hard anodized, scratch-resistant, durable finish to provide years of rigorous testing and trouble-free service.

The test fixture includes the card clamping stand, a card stop gauge to provide the precise cantilever dimension and a movable stainless steel scale for precision accuracy.

BQ Technologies' Resistance to Heat Test Fixture is designed to perform this test according to the following standards:

- MasterCard CQM
- ISO/IEC 7810
- ISO/IEC 10373-1
